

Sitemap Generation Implementation Plan

For agentic workers: REQUIRED SUB-SKILL: Use superpowers:subagent-driven-development (recommended) or superpowers:executing-plans to implement this plan task-by-task. Steps use checkbox (- []) syntax for tracking.

Goal: Add sphinx-sitemap extension to generate full per-page sitemaps for all ~250 documentation pages across 4 active versions.

Architecture: Add one dependency, configure 4 lines in conf.py. RTD handles the rest automatically.

Tech Stack: sphinx-sitemap 2.6.0, Sphinx 7.2.6, Read the Docs

Spec: docs/superpowers/specs/2026-03-21-sitemap-design.md

Task 1: Create branch and add sphinx-sitemap dependency

Files: - Modify: requirements.txt

- ☐ **Step 1: Create feature branch**

```
cd /Users/syncer/GitHub/vyos-documentation
git checkout -b feat/sitemap-generation origin/current
```

- ☐ **Step 2: Add sphinx-sitemap to requirements.txt**

Add sphinx-sitemap==2.6.0 after the existing sphinx_design entry in requirements.txt:

```
urllib3==2.6.3
Sphinx==7.2.6
sphinx-rtd-theme==2.0.0
sphinx-autobuild==2021.3.14
sphinx-notfound-page==1.0.0
lxml==5.1.0
myst-parser==2.0.0
sphinx_design==0.5.0
sphinx-sitemap==2.6.0
```

- ☐ **Step 3: Commit**

```
git add requirements.txt
git commit -m "deps: add sphinx-sitemap 2.6.0 for per-page sitemap generation"
```

Task 2: Configure sphinx-sitemap in conf.py

Files: - Modify: docs/conf.py

- ☐ **Step 1: Add sphinx_sitemap to extensions list**

In docs/conf.py, add 'sphinx_sitemap' to the extensions list (line 43-52). Insert after 'vyos':

```

extensions = ['sphinx.ext.intersphinx',
              'sphinx.ext.todo',
              'sphinx.ext.ifconfig',
              'sphinx.ext.graphviz',
              'notfound.extension',
              'autosectionlabel',
              'myst_parser',
              'sphinx_design',
              'vyos',
              'sphinx_sitemap',
]

```

- ☐ **Step 2: Add sitemap configuration variables**

Add the following after the `autosectionlabel_prefix_document = True` line (around line 58):

```

# sphinx-sitemap configuration
html_baseurl = 'https://docs.vyos.io/'
sitemap_url_scheme = '{lang}{version}{link}'
sitemap_locales = [None]

```

- ☐ **Step 3: Commit**

```

git add docs/conf.py
git commit -m "feat: configure sphinx-sitemap for full per-page sitemap
generation

```

Enables `sitemap.xml` generation with every documentation page.
 RTD merges per-version sitemaps into a `sitemapindex` at the domain root.
 URL scheme supports future i18n via `{lang}` placeholder."

Task 3: Create PR

- ☐ **Step 1: Push and create PR**

```

git push -u origin feat/sitemap-generation
gh pr create --title "Add sphinx-sitemap for full per-page sitemap generation" --
body "$(cat <<'EOF'
## Summary
- Add `sphinx-sitemap==2.6.0` dependency
- Configure sitemap generation in `conf.py` with RTD-compatible URL scheme
- Replaces RTD's minimal 4-URL auto-sitemap with full per-page sitemaps (~250
URLs per version)
- Future-proofed for i18n via `sitemap_locales` config

## How it works
Each version build produces a `sitemap.xml` with every page. RTD merges these
into a `sitemapindex.xml` at `https://docs.vyos.io/sitemap.xml`. The existing
`robots.txt` already points to this URL.

## Test plan

```

- [] Verify RTD build succeeds
- [] Check PR preview build produces sitemap.xml
- [] After merge, verify `https://docs.vyos.io/sitemap.xml` is a sitemapindex
- [] Verify individual page URLs appear in version sitemaps

EOF

)"

Task 4: Verify sitemap in PR preview build

- ☐ **Step 1: Wait for RTD preview build to complete**

Check the PR checks for the RTD build status.

- ☐ **Step 2: Fetch the preview sitemap**

```
curl -s https://vyos-<PR_NUMBER>.org.readthedocs.build/en/<PR_NUMBER>/
sitemap.xml | head -20
```

Verify it contains `<url>` entries with page URLs, not just the version root.
